

PERSONALIZED LEARNING WITH GENERATIVE AI AND LMS INTEGRATION

PROJECT DOCUMENTATION

Title : Personalized learning with generative ai and lms integration

Team member :GOPERUNDEVI R

Team member:KAVIYA V

Team member:KAVIPRIYA

Team member: DHARSHINI T

Team member: PANDIMEENA R

PROJECT OVERVIEW:

Integrating generative AI and Learning management system (LMS) revolutionize the learning experience by providing personalized, adaptive and interactive content . Here's an overview of the project

FEATURES:

- ***Automated Content Creation***: Generative AI automates the creation of learning materials, saving time and resources for instructional designers and educators.
- ***Personalized Learning Paths***: AI-powered systems analyze learner data and preferences to generate tailored content, improving engagement, motivation, and knowledge retention.
- ***Real-time Feedback and Support***: Chatbots and virtual assistants provide instant feedback and support, enhancing learner engagement and understanding.
- ***Adaptive Learning***: AI-driven systems adjust the difficulty level and content based on learner performance, ensuring an optimal learning experience.

BENEFITS:

- ***Enhanced Learner Experience***: Personalized learning paths and interactive content increase learner engagement and motivation.
- ***Increased Efficiency***: Automated content creation and grading reduce administrative burdens on educators.
- ***Improved Learning Outcomes***: Targeted interventions and real-time feedback help learners overcome knowledge gaps and achieve better results.

TECHNICAL REQUIREMENTS:

- ***Generative AI Model***: Integrate a generative AI model that can analyze learner data and generate personalized content.
- ***LMS Integration***: Seamlessly integrate the AI-powered system with existing LMS platforms.
- ***Data Analytics***: Leverage data analytics to track learner progress and adjust the AI-powered system accordingly.

POTENTIAL APPLICATIONS:

- ***Education***: Personalized learning platforms for students, enhancing engagement and academic performance.
- ***Corporate Training***: AI-powered LMS for employee development, improving knowledge retention and job performance.

CONVERSATIONAL INTERFACE :

key points : Natural language processing

POLICY SUMMARIZATION:

Policy summarization involves condensing complex policies into concise, easily digestible summaries, highlighting key points, benefits, and implications.

APPLICATION:

1. ***Government Policies***: Summarizing policies for citizens, stakeholders, and policymakers.
2. ***Corporate Policies***: Communicating policies to employees, customers, and partners.
3. ***Regulatory Compliance***: Summarizing regulatory requirements for organizations.

TECHNIQUES:

1. ***Natural Language Processing (NLP)***: Analyzing and summarizing policy documents using NLP techniques.
2. ***Machine Learning***: Training models to identify key policy aspects and generate summaries.
3. ***Human Expertise***: Leveraging expert knowledge to create accurate and informative summaries.

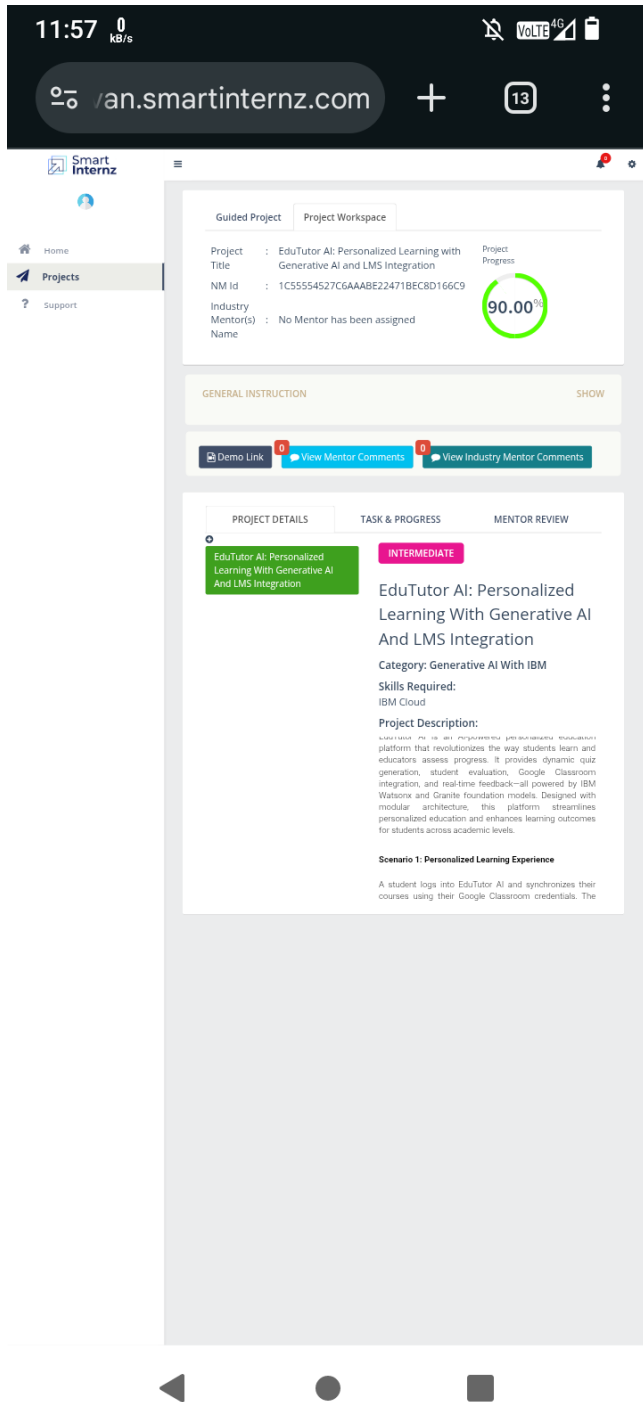

TOOLS

1. ***Policy Summarization Software***: Utilizing software to automate policy summarization.
2. ***AI-powered Tools***: Leveraging AI-powered tools to analyze and summarize policies.

CHALLENGES:

1. ***Complexity***: Policies can be complex and nuanced, making summarization challenging.
2. ***Accuracy***: Ensuring summaries accurately reflect policy details and implications.
3. ***Context***: Considering context and stakeholder needs when creating summaries.

KEY DETAILS

Edit with WPS Office

- ***Project Title*:** EduTutor AI: Personalized Learning with Generative AI and LMS Integration
- ***Project Progress*:** 90%
- ***Category*:** Generative AI with IBM
- ***Skills Required*:** IBM Cloud
- ***Project Description*:** EduTutor AI is a platform that customizes learning paths for students using generative AI, providing dynamic quizzes, hints, and real-time feedback powered by IBM Watson and Granite foundation models.

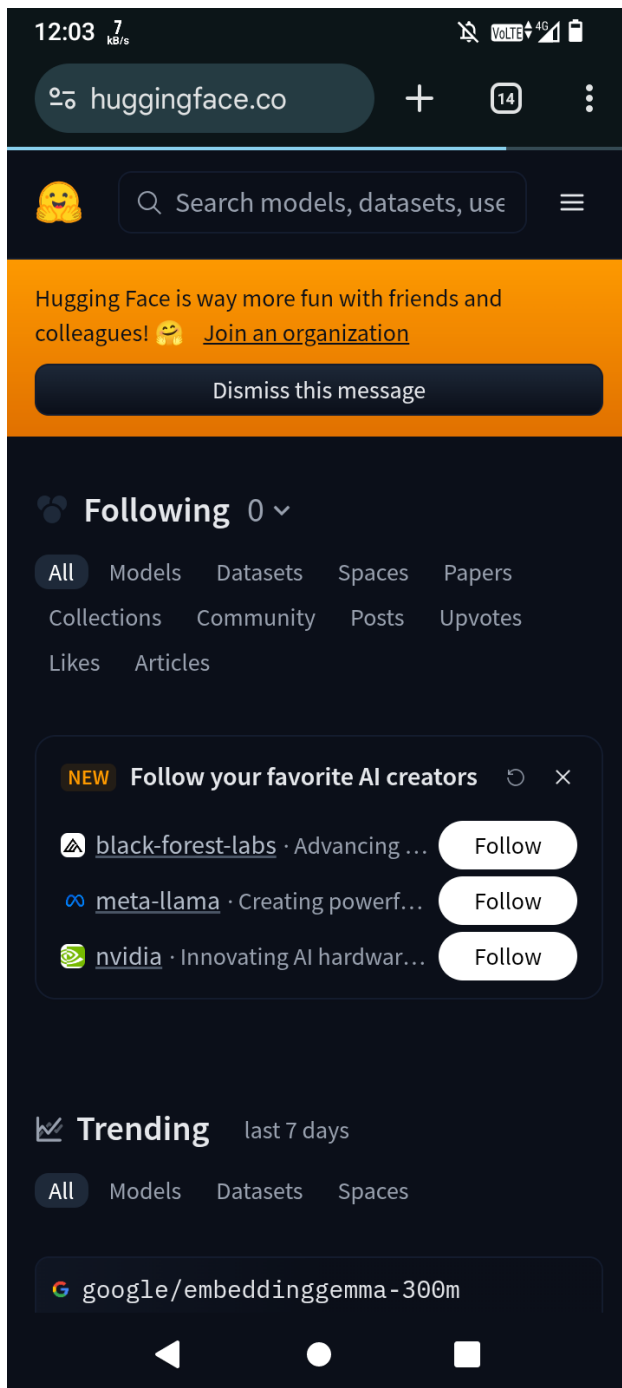

PROJECT ASPECTS:

- ***Personalized Education*:** Enhances learning outcomes for students across various academic levels.
- ***Scenario 1*:** Personalized Learning Experience - students log in using Google Classroom credentials.

PLATFORM FEATURE:

- ***Guided Project*:** Part of Smart Internz's guided projects.
- ***Project Workspace*:** Accessible with details on tasks and progress.

*And create a hugging face and access token and search a IBM granite 3.2-2b instruct using Google colab

Edit with WPS Office

```
#Educational AI Application using IBM Granite Model
#Run this in Google Colab
!pip install transformers torch gradio -q

import gradio as gr
import torch
from transformers import AutoTokenizer, AutoModelForCausalLM

# Load model and tokenizer
model_name = "ibm-granite/granite-3.2-2b-instruct"
tokenizer = AutoTokenizer.from_pretrained(model_name)
model = AutoModelForCausalLM.from_pretrained(
    model_name,
    torch_dtype=torch.float16 if torch.cuda.is_available() else torch.float32,
    device_map="auto" if torch.cuda.is_available() else None
)

if tokenizer.pad_token is None:
    tokenizer.pad_token = tokenizer.eos_token

def generate_response(prompt, max_length=512):
    inputs = tokenizer(prompt, return_tensors="pt", truncation=True, max_length=512)
    if torch.cuda.is_available():
        inputs = {k: v.to(model.device) for k, v in inputs.items()}
    with torch.no_grad():
        outputs = model.generate(
            **inputs,
            max_length=max_length,
            temperature=0.7,
            do_sample=True,
            pad_token_id=tokenizer.eos_token_id
        )
    response = tokenizer.decode(outputs[0], skip_special_tokens=True)
    response = response.replace(prompt, "").strip()
    return response

def concept_explanation(concept):
    prompt = f"Explain the concept of {concept} in detail with examples:"
    return generate_response(prompt, max_length=800)

def quiz_generator(concept):
    prompt = f"Generate 5 quiz questions about {concept} with different question types (multiple choice, true/false, short answer):"
    return generate_response(prompt, max_length=1000)

# Create Gradio interface
with gr.Blocks() as app:
    gr.Markdown("# Educational AI Assistant")
    with gr.Tabs():
        with gr.TabItem("Concept Explanation"):
            concept_input = gr.Textbox(label="Enter a concept", placeholder="e.g., machine learning")
            explain_btn = gr.Button("Explain")
            explanation_output = gr.Textbox(label="Explanation", lines=10)
            explain_btn.click(concept_explanation, inputs=concept_input, outputs=explanation_output)
        with gr.TabItem("Quiz Generator"):
            quiz_input = gr.Textbox(label="Enter a topic", placeholder="e.g., physics")
            quiz_btn = gr.Button("Generate Quiz")
            quiz_output = gr.Textbox(label="Quiz Questions", lines=15)
            quiz_btn.click(quiz_generator, inputs=quiz_input, outputs=quiz_output)
    app.launch(share=True)
```

Model and Tokenizer Loading

The code loads the `ibm.granite/granite-3.2-2b-instruct` model and tokenizer using the Hugging Face

Edit with WPS Office

Transformers library. It also sets the ``pad_token`` to ``eos_token`` if it's not already set.

Response Generation

The ``generate_response`` function takes a prompt and generates a response using the model. It uses the ``tokenizer`` to encode the prompt, passes it through the model, and then decodes the output. The response is then stripped of the original prompt and any special tokens.

Concept Explanation and Quiz Generation

The ``concept_explanation`` and ``quiz_generator`` functions use the ``generate_response`` function to generate explanations and quizzes based on user input. The prompts are crafted to elicit specific responses from the model.

Gradio Interface

The code creates a Gradio interface with two tabs: "Concept Explanation" and "Quiz Generator". Each tab has a text input field, a button to generate the response, and a text output field to display the result. When the button is clicked, the corresponding function is called, and the response is displayed in the output field.

Launch

Finally, the app is launched with ``share=True``, which allows others to access the app via a shared link.

Overall, this code provides a solid foundation for an educational AI assistant that can explain concepts and generate quizzes. With some fine-tuning and customization, it could be a valuable tool for students and educators alike!

Concept Explanation

The concept explanation feature uses the `concept_explanation` function to generate detailed explanations of concepts with examples.

Edit with WPS Office

How it Works

1. ***User Input*:** The user enters a concept in the "Enter a concept" textbox.
2. ***Prompt Generation*:** The ``concept_explanation`` function generates a prompt to explain the concept in detail with examples.
3. ***Model Generation*:** The ``generate_response`` function uses the model to generate a response based on the prompt.
4. ***Output*:** The generated explanation is displayed in the "Explanation" textbox.

Example Use Cases

- Explaining machine learning concepts, such as supervised learning or neural networks.
- Describing scientific concepts, such as photosynthesis or climate change.
- Providing examples of historical events or cultural phenomena.

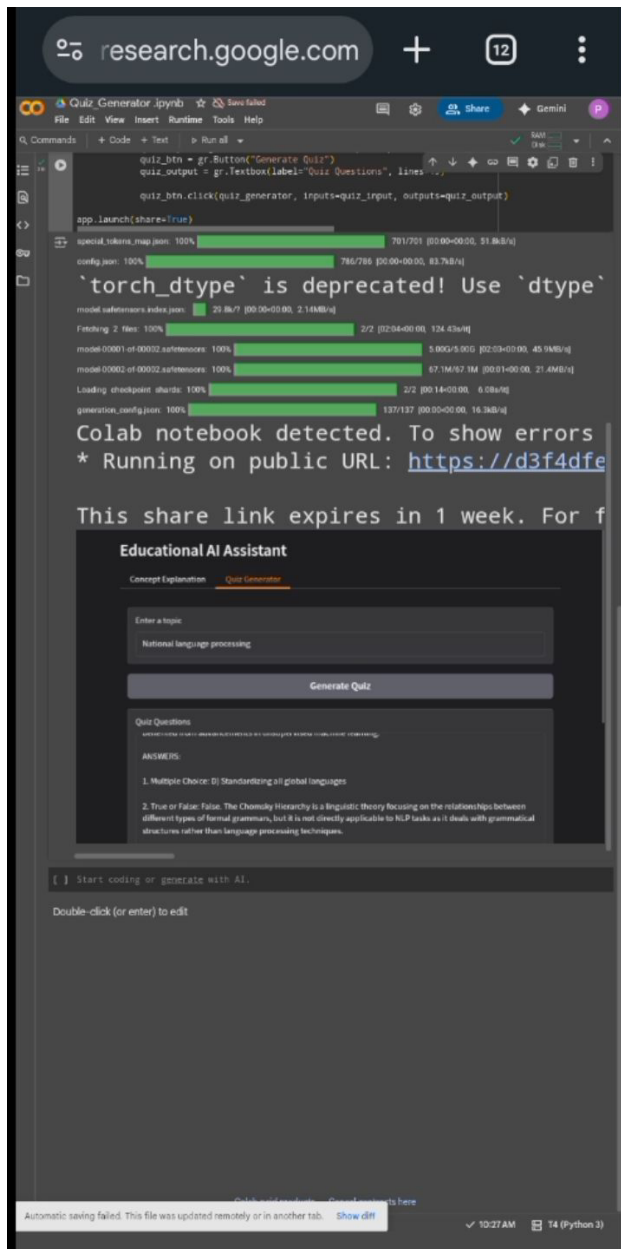

Customization

- Adjusting the ``max_length`` parameter to control the length of the generated explanation.
- Modifying the prompt template to change the tone or style of the explanation.

Potential Applications

- Educational platforms: Integrating the concept explanation feature into online learning platforms or educational resources.
- Research assistance: Using the feature to generate explanations of complex research topics or concepts.
- Content creation: Utilizing the feature to create educational content, such as blog posts or study guides.

Quiz Generator

The quiz generator feature uses the `quiz_generator` function to create quiz questions with different types (multiple choice, true/false, short answer) based on a given topic.

How it Works

Edit with WPS Office

1. ***User Input*:** The user enters a topic in the "Enter a topic" textbox.
2. ***Prompt Generation*:** The ``quiz_generator`` function generates a prompt to create quiz questions about the topic.
3. ***Model Generation*:** The ``generate_response`` function uses the model to generate quiz questions based on the prompt.
4. ***Output*:** The generated quiz questions are displayed in the "Quiz Questions" textbox.

Example Use Cases

- Generating quizzes for educational purposes, such as assessing student knowledge or understanding.
- Creating practice quizzes for test preparation or review.
- Developing assessments for professional development or training programs.

Customization

- Adjusting the ``max_length`` parameter to control the length of the generated quiz questions.
- Modifying the prompt template to change the format or style of the quiz questions.

Potential Applications

- Educational institutions: Integrating the quiz generator into online learning platforms or educational resources.
- Test preparation services: Using the feature to create practice quizzes for standardized tests or exams.
- Corporate training: Utilizing the feature to develop assessments for employee training or professional development.
